TITLE: Making the block walling (of a boiler) with chamotte concrete lining. (Vypolneniye blochnoy obmurovki s sham-otobetonnoy futerovki)

PERIODICAL: "Elektricheskie Stantsii" (Power Stations), 1957,  
Vol. 28, No.2, pp. 77 - 79 (U.S.S.R.)

ABSTRACT: This short practical article describes how in a boiler type ТН-230-2, 83% of the lining was carried out in blocks with a fire-resistant lining consisting of chamotte-concrete using Portland cement. The lining work was carried out during the assembly of the blocks so that they could be made by factory methods, the total weight of lining was reduced and scarce lining materials were replaced by easily available materials. The individual blocks ranged in weight from 1 - 60 tons. The procedure is described and illustrated with diagrams. The composition of the cement is given and its method of use described. The lining work was carried out in 40 days working two shifts per day. Twelve men were employed on preparing cement, the lining was carried out by three squads each of four men. Two 15 ton cranes were used. There are 2 figures.

AUTHOR: Faynshteyn, A.S., Engineer. 104-4-23/40

TITLE: Methods of erecting trestle cranes. (Metody Montana koz-lovykh kranov)

PERIODICAL: "Elektricheskie Stantsii" (Power Stations), 1957,  
Vol.28, No.4, p. 76 (U.S.S.R.)

ABSTRACT: Trestle type cranes with a lifting capacity of 20 tons and a span of 20 or 32 m are becoming widely used during the erection of power stations. The method of erecting the cranes recommended by the manufacturers requires much preparational work on the installation of masts, of supports under the masts and other equipment. This brief note describes simpler methods of doing the work. One method involves the use of a mobile railway crane running on the tracks spanned by the crane being erected. A second method involves the use of a tractor and pulley blocks one of which is fastened to the assembled crane tower and the other to the power station wall.

TITLE: Large Unit Assembly of a Front-End Boiler of TP-230-2 Type  
(Krupno-blochnyy montazh tortsovogo kotloagregata tipa  
TP-230-2)

PERIODICAL: Energetik, 1958, Nr 10, pp 8 - 9 (USSR)

ABSTRACT: The author states that in the thermo-electric power station (TETS) boiler works, two bridge cranes have been installed, each with a lifting capacity of 15 tons, which enable the assembly of boiler units to be carried out by using large scale heavy blocks. He adds that a technique of assembling a TP-230-2 type front-end boiler has been developed, and proceeds to describe in detail the various steps in this method of assembly. The author concludes by stating that the coefficient of unit assembly for the metal parts of the boiler was 92.4%, and for the lining, 20.8%. There are 2 diagrams.

TITLE: Instrument for turbidimetric titration of polymers

SOURCE: Zavodskaya laboratoriya, v. 30, no. 1, 1964, 104-105

TOPIC TAGS: turbidimetric titration, polymer, colorimeter, interpolymer formation, potentiometer

ABSTRACT: The instrumentation for turbidimetric titration of polymers with automatic turbidity recording has been discussed. The components of the experimental setup consist of a photoelectric colorimeter type FEK-4, an electron potentiometer EPP-09 connected in parallel to a galvanometer, and a shunt for measuring the general sensitivity of the instrument. The precipitation curves of several polymers (polyisobutylene, SKS-10 rubber, etc.) are obtained. The results indicate possible interpolymer formations in the various polymer systems investigated.

AUTHOR: Faynshteyn, E. G., Docent, Candidate of Technical Sciences 105-58-4-9/37

TITLE: Determination of the Power Rating of an Electromotor With Variable Load (Opredeleniye moshchnosti elektrosvigatelyy pri peremennoy nagruzke)

PERIODICAL: Elektrichestvo, 1958, Nr 4, pp. 44-48 (USSR)

ABSTRACT: As in most cases the load of a motor changes with time there is the problem of selecting the power rating according to the heating in the substitute of the real diagram giving the change of load by an equivalent diagram of a arbitrary constant load. This equivalent diagram is based on the wear-function  $f = Ze^{\alpha\theta}$  dependent upon the temperature  $\theta$ . According to numerous investigations during the last 30-35 years this is  $f = Ze^{\alpha\theta}$ . The factor has different values for insulations of different types. In the case of insulations of organic origin it is equal to 0,0693. Z does not influence the results of analyses. Starting from the general foundations of the theory of wear it is shown here that the selection of the motor according to the method of mean losses forms a special case of the more general

Card 1/4

Determination of the Power Rating of an Electromotor With 105-58-4-9/37  
Variable Load

method. The limits within which the applied formulae remain valid are determined and it is shown that the use of this formula beyond these limits brings about essential deviations. The basic formula for the selection of the motor in the case of arbitrary load character is the equality of insulation wear in the motor in the case of operation below the normal temperature  $\theta_n$  with the wear of the temperature  $\theta(t)$  changing according to time during the whole life of the motor  $t^L$ . Formula (2). The motor was correctly selected when  $\theta_a^{(equivalent)} \leq \theta_{normal}$ . The

problem is made easier by the possibility to determine the components of  $\theta_a$  according to the known diagrams  $\theta(t)$  and  $\tau(t)$ . As was shown by the measurements of the temperature of the cooling agent in various climatological investigations this temperature changes harmonically during one day and one year. From the given equation (4) the equation (5) for the determination of an equivalent cooling agent temperature on natural conditions or for unheated rooms can be formed. The dependence of the temperature excess according to time  $\tau(t)$  is given in form of (6), while that temperature-excess

Card 2/4

Determination of the Power Rating of an Electromotor With      105-58-4-9/37  
Variable Load

from (4) and (6) equivalent to the wear is given in form of equation (7) for  $\tau_{\text{a}}$ . The equivalent excess of temperature differs from the average by the magnitude of the additional component  $\Delta\tau_{\text{a}}$ . For the evaluation of the decrease in life caused by  $\Delta\tau_{\text{a}}$  and the necessity of taking it into account in the selection of the motor the author determines the limits within which the value of their dependence on the maximum fluctuation of the function  $\tau(t)$  is located. For the construction of the diagram  $\tau(t)$  Petrov suggested a rather useful method in reference 8.  $\Delta\tau_{\text{a}}$  can, however, also be determined without using the  $\tau(t)$ -diagram. Such a method, namely that by S. A. Rinkevich (ref. 9), is used. Based on the explanations, the sequence in the selection of the motor under change of load is given: 1) Determination of the temperature of the cooling agent  $\tau_{\text{a}}$ , 2) Determination of the tolerable temperature excess  $\tau_{\text{mean tolerable}}$ . Diagrams for most forms of periodic load occurring in practice are given.

Summary: 1) The methods for the selection of the motors

Card 3/4

Determination of the Power Rating of an Electromotor With Variable Load 105-58-4-9/37

according to heating in the case of change of load must be given on the basis of the rules of wear. 2) The practical realization of these theories consists in the fact that the motor capacity selected for the security of the given load diagram according to the method of mean deviations must be "corrected". 3) The correction must take into account not only the temperature-excess of the cooling agent above the normal temperature demanded by GOST but also an additional wear caused by temperature fluctuations as well as shift work. There are 7 figures and 10 references, 9 of which are Soviet.

TITLE:

Calculation of transient processes

PERIODICAL:

Avtomatika i telemekhanika, v. 23, no. 6, 1962,  
833-840

TEXT: A method of calculation of a transient process is given which is exact when the action function has the form of an algebraic polynomial. In other cases the method is approximate. The analysis is based on the relationship  $X(p) = F(p) W(p)$ , connecting the reaction function  $x(t)$  and the action function  $f(t)$ , where  $X(p)$  - Laplace transform of the reaction function  $x(t)$ ,  $F(p)$  - Laplace transform of the action function  $f(t)$ ,  $W(p)$  - transfer function of the system. Both cases of zero and non-zero initial conditions are considered. A generalized formula is deduced from which particular cases corresponding to various forms of the action approximation function  $f(t)$  can follow. Examination of this formula and of the particular cases shows that for the evaluation of the transient

Card 1/2

Calculation of transient processes

S/103/62/023/006/012/012  
D230/D308

processes, knowledge of the transient function  $K_r(t)$  is required. The relation between the action approximation function and the resulting transient process error is obtained. A case is considered when the poles of the transmitting function  $W(p)$  are not known or, when the delayed dynamic system has both lumped and distributed parameters. Employing sums with trapezoidal characteristics, a transient function  $K_r(t)$  can be evaluated with the aid of sine and cosine integrals. For a polynomial form of action function, the accuracy of the formation of the transient process is entirely dependent on the accuracy of the time function  $K_r(t)$ . There are 1 table and 4 figures.

"New Method of Introducing Penicillin Lengthening Its Effectiveness," F. E. Faynstein, F. I. Bolotnikova, Hematol, Cen Order of Lenin Inst of Hematol and Blood Transfusion

"Klin Med" Vol XXIX, No 10, pp 14, 15

Grozov and Bolotnikova developed a method of mixing penicillin with blood, erythrocytic mass, or solution No 94, lengthening the time during which the soln remains in the organism. Intramuscular injections were given to volunteers and 15 patients ill with chronic myelosis and 5 with chronic lymphadenosis. One cc of the penicillin soln containing 50,000 units mixed with 1 cc blood or erythrocytes were injected in the upper lateral quadrant of the buttocks. Ten controls received penicillin in aqueous soln. The concn of penicillin mixed with blood serum was determined by a modification of Fleming's phenol red method in 2, 3, 4, 5, and 6 hr after injection. Altogether there were 30 tests showing that in leucosis patients the penicillin level was kept up for 5-6 hr. In the controls the therapeutic level was retained only for 2-3 hr. Admin of blood or erythrocytes to penicillin therefore lengthened the time of effectiveness in the blood stream 2-3 times. It is evident that in this method the penicillin forms a depot at the point of injection from which it spreads into the organism. No adverse effects were discovered.

"Certain Problems in the Clinical Management and Therapy of Aplastic and Hypoplastic Anemia," by F. E. Faynshteyn, Central Order of Lenin Institute of Hematology and Blood Transfusion (director, Prof A. A. Bagdasarov, Corresponding Member, Academy of Medical Sciences USSR, Ministry of Health USSR, Problemy Gematologii i Perelivaniya Krovi, Vol 1, No 5, Sep/Oct 56, pp 20-27

A total of 100 patients ranging in age from 18 to above 60 and suffering from aplastic or hypoplastic anemia were subjected to complex therapy by (a) transfusion of erythrocyte mass, folic acid, vitamin B<sub>12</sub>, ascorbic acid, vitamin P, and calcium preparation; or (b) transfusion of erythrocyte mass, vitamins B<sub>1</sub>, B<sub>2</sub>, B<sub>6</sub>, B<sub>12</sub>, folic acid, vitamin P, ascorbic acid, and calcium preparation.

The author concludes that both thrombocytopenia and vascular disturbances play an important role in bringing about aplastic and hypoplastic anemia. Systematic transfusion of erythrocyte mass has an essential place in the complex therapy of aplastic and hypoplastic anemia. A favorable effect is sometimes exerted by the combination of erythrocyte mass with B vitamins. The use of vitamin P together with ascorbic acid and calcium preparation and also native plasma often aids in arresting hemorrhage. Therapy by ACTH may be recommended in certain cases of chronic hypoplastic anemia.

"On the Role of the Vascular Factor in the Mechanism of Development of Hemorrhage in Aplastic and Hypoplastic Anemia," by F. E. Faynshteyn, Central Order of Lenin Institute of Hematology and Blood Transfusion (director, Prof A. A. Bagdasarov, Corresponding Member, Academy of Medical Sciences USSR), Ministry of Health USSR, Problemy Gematologii i Perelivaniya Krovi, Vol 2, No 2, Mar/Apr 57, pp 30-34

The article describes characteristics of the capillaries in various types of aplastic and hypoplastic anemia in which, as is known, hemorrhage often is prominent.

A study of the capillaroscopic picture confirms the significance of the vascular factor in the mechanism of the development of hemophilia in aplastic and hypoplastic anemia. The most marked changes in the capillaroscopic picture were noted in aplastic and subacute hypoplastic anemia. In patients with chronic hypoplastic anemia during remission, a tendency toward normalization of the capillaroscopic picture is observed. (U)

"Pressing Problems of Hematology and Blood Transfusion," by  
F. E. Faynshteyn, Candidate of Medical Sciences, and Yu. I.  
Loriye, Central Order of Lenin Institute of Hematology and  
Blood Transfusion, Moscow, Zdravookhraneniye Kazakhstana,  
No 3, 1957, pp 3-10

The Central Order of Lenin Institute of Hematology and Blood Transfusion defines leukosis and reviews means for its therapy. This institute also touches upon effects of ionizing radiation and summarizes blood preservatives and blood substitutes.

Among therapeutic agents mentioned are "dopan," a uracil derivative, 6-mercaptopurine, fresh plasma in combination with vitamin B complex, leukocyte mass, iron-ascorbic acid and "ferkoven," ACTH and cortisone, Vitamin B<sub>12</sub>, antihemolytic globulin, and thrombocyte mass.

Some of the blood preservatives mentioned are glucose-citrate, saccharose-citrate, anticytolysing substances of Soviet preparation such as diprozin, ethizin, and aminazin, ion-exchange adsorbents, chemical stabilizers, and quick cooling and freezing methods.

Blood substitutes, besides whole blood, include heterogenous blood, and synthetic blood substitutes such as the Therapeutic Serum of Belen'kiy, BK-8, colloidal infusions, and protein hydrolysates. Other blood substitutes mentioned are the dextren type of preparation (polyglyukin, sinkol, macrodex, and intradex), and periston (polyvinyl-pyrrolidone). (U)

Orig Pub : Voen.-med. zh., 1957, No 11, 31-36

Abstract : In 40 patients with aplastic and 70 with hypoplastic anemia, the best results were obtained with hemotherapy. The blood was prepared by means of ion exchange adsorbents (cationic blood) and given by the drip method in volumes of 200 - 250 ml at intervals of 2 - 3 days at the beginning of treatment, and of 4 - 5 days thereafter. In contradistinction to citrate blood, the leukocytes and platelets of the cationic blood are functionally fully effective for long duration. The adaptation ability of the erythrocytes is almost the same as in a direct

transfusion. The antibodies, hormones and enzymes are retained. In hypoplastic anemias with hemolytic components, transfusions of fresh plasma are effective, especially when given in combination with group B vitamins. In absence of hemorrhages, good results were obtained with transfusions of an erythrocyte mass. Cortisone and ACTH had a positive effect. -- Z. R. Paley

Abstract: The thrombocytes (T) of healthy humans and those afflicted with leukemia and aplastic and hypoplastic anemia were studied with an electron microscope having a magnification of 7000 X. In the center of the T of healthy individuals one distinguishes a granular granulomere and on the periphery a hyalomere consisting of a net of intertwining fibrils, forming numerous projections, branchings

and pseudopods. The T of those afflicted with aplastic and hypoplastic anemia were conspicuously distinguished either by the complete absence or a very small number of branchings and pseudopods, a smoother surface, and effaced boundaries between the granulomeres and hyalosomes. The great number of vacuoles inside the lamina is proof of their degenerative changes. Substantial degenerative changes also characterize the T of those afflicted with leukemia. The authors think that these findings may prove highly significant in understanding the mechanism of the development of hemorrhages which accompany these diseases. -- A.M. Karpas.
